Our Academy

Aerojet Aviation Training Academy is Africa's foremost institution and leader in the field of Aviation Training and Engineering.

Training Engineers for one of the most demanding professions in the world is a truly important responsibility that we take very seriously. At Aerojet we are extremely committed to educating, mentoring and preparing aircraft engineers to the highest standards, ensuring you have successful career as an Aircraft Engineer.

As direct recipients of trained personnel via Aerojet's Engineering Division, we know what it takes and understand the importance of the knowledge and preparation we give to student that come through our institution.

During your training you will gain direct insight into how work is carried out in a live aircraft hangar and become conversant with the required processes employed by Aircraft Maintenance companies to ensure the safe operation of commercial aircraft today.

Depending on your chosen program you will be supported by being given the opportunity to work train in Aerojet's EASA Part 145 Facility or an of our partner facilities worldwide to help you gain the best Hands-on experience needed to pursue a career in Aircraft Engineering.

Careers In Aircraft Engineering

Careers in aviation expand beyond many industries, but Aircraft Engineering plays a crucial role in ensuring the safety and efficiency of aircraft travel.

Points to Consider Regarding Career Opportunities:

- Depending on which part of the world you are in, your experience and type ratings, **Licensed Aircraft Engineers** can earn from £12,000 at entry level to £50,000 or more annually with many years of experience. With flexible shift schedules, you can enjoy a good quality of life and job satisfaction.
- The demand for Licensed Aircraft Engineers remains high due to the ongoing growth in the aviation industry. Opportunities to work for major airlines and MRO's are widely available.
- The role of Aircraft Engineers is vital in ensuring the safety and reliability of air travel, as planes cannot fly without their expertise and professional diligence.

Aircraft Engineering Qualifications:

What type of Engineer you want to be, will determine what qualification will you require. To help you choose, you will first need to understand something of the process of certification.

At Aerojet we train engineers and technicians to be certified to EASA Certification standards as this is the most widely accepted qualification for Aircraft maintenance personnel in the industry. The European Aviation Safety Agency (EASA) is the organisation that regulates all aviation activity within Europe and delegates authority for implementation of its regulations to its member National Aviation Authorities.

To ensure safety within the industry, engineering personnel are licensed in the same way as pilots and air traffic controllers. If suitably licensed an engineer can certify the work that has been carried out on an aircraft and return it to service.

There are several categories of licence which cover different levels and disciplines and, as in other professions, a variety of routes exist to achieve them. Let us deal with the type of work and the licences required first.

A Ramp or Line Maintenance Certifying Mechanic (Category A Licence Mechanic) is a person who is qualified to work on operational aircraft performing relatively minor maintenance tasks and replacement of parts that are required between major service overhauls and to subsequently certify these tasks; this work is generally done while the aircraft is in service, during turnarounds at airports or overnight.

Aerojet Academy only provides A Category license course training at the request of Aerojet Engineering on an on-demand basis. However, at the Academy our primary focus is training for the higher-level Category B License.

Understanding Category B Licencing

The Aircraft Maintenance Licence (AML) B1 Category allows the holder to issue certifications of release to service, following maintenance, including aircraft structure, power plants and mechanical and electrical systems. Authorisation to replace avionic line replaceable units (LRUs) requiring simple tests to prove their serviceability is also permitted. The Licence holder is qualified to work on aircraft that require more complex maintenance tasks or have been withdrawn from service for routine periodic servicing or major overhauls and re-fits and who can then subsequently certify his/her own and other work.

The Aircraft Maintenance Licence (AML) Category B2 allows the holder to issue certificates of release to service, following maintenance on avionic and electrical systems. A B2 Avionics Engineer specialises in scheduled maintenance, restoration and modification of communication, navigation, radar equipment, as well as guidance and control systems including auto-pilot/auto-land and cabin entertainment – generally all Electronic systems fitted to all aircraft across all categories.

For the purposes of the programs we offer at Aerojet Academy, we offer B Licence training as per the sub-categories shown below:

Licence Categories

- **Category B1.1**
Aeroplanes Turbine – Mechanical
- **Category B1.2**
Aeroplanes Piston – Mechanical
- **Category B1.3**
Helicopters Turbine – Mechanical
- **Category B1.4**
Helicopters Piston - Mechanical
- **Category B2**
Avionics
